Can Career, Technical and Vocational Education and Training (CTVET) serve as a tool for poverty alleviation and solve economic problems for nations? CTVET include a wide range of learning experiences which are relevant to the world of work and which may occur in a variety of learning contexts, including educational institutions and the workplace. These include learning designed to develop the skills for practicing particular occupations and careers, as well as learning designed to prepare for entry or re-entry into the world of work in general. (Adopted from Morris, 2015 and UNESCO, 2006)

The Secretariat's work programme on improving basic education is targeted to teacher education in Commonwealth countries. It is widely recognised that teachers are central to quality education. A well prepared and motivated teaching force is essential for effective teaching and learning. The Secretariat is engaged, therefore, in a range of measures which include seminars, workshops and development, as well as the publication of resource materials for the training and professional development of teachers.

An additional chapter on Mobile Computing and other state-of-the-art innovations in the IT world have been incorporated. Not only that, the latest Internet technologies have also been covered in detail. This book presents current perspectives on theoretical and empirical issues related to the teaching and learning of geometry at secondary schools. It contains chapters contributing to three main areas. A first set of chapters examines mathematical, epistemological, and curricular perspectives. A second set of chapters presents studies on geometry instruction and teacher knowledge, and a third set of chapters offers studies on geometry thinking and learning. Specific research topics addressed also include teaching practice, learning trajectories, learning difficulties, technological resources, instructional design, assessments, textbook analyses, and teacher education in geometry. Geometry remains an essential and critical topic in school mathematics. As they learn geometry, students develop essential mathematical thinking and visualization skills and learn a language that helps them relate to and interact with the physical world. Geometry has traditionally been included as a subject of study in secondary mathematics curricula, but it has also featured as a resource in out-of-school problem solving, and has been connected to various human activities such as sports, games, and artwork. Furthermore, geometry often plays a role in teacher preparation, undergraduate mathematics, and at the workplace. New technologies, including dynamic geometry software, computer-assisted design software, and geometric positioning systems, have provided more resources for teachers to design environments and tasks in which students can learn and use geometry. In this context, research on the teaching and learning of geometry will continue to be a key element on the research agendas of mathematics educators, as researchers continue to look for ways to enhance student learning and to understand student thinking and teachers' decision making.
